

## Downloading the Images

After you take pictures with a digital camera you have to download the images into your computer. To download the images into the computer we will use card readers. The card readers that we have are able to read various types of cards. Most likely our readers will be able to read the card from your camera. Our Digital Rebel cameras use a two types of cards. One is called CF and the other is SD. Below are the instructions for the CF cards, however the SD cards are similar.

### Steps for Downloading:

1. Upon returning to the room, locate a card reader. They can be checked out from Sheri in her office. In Fig. #1, are some examples of what card readers look like.

2. Plug the end of the connection cord (See letter A) into the USB slot on the front of the tower.

3. Take out the card from the camera by opening the door on the card right side of the camera. The Canon cards come out by pushing a button below the card for the CF cards or pushing the card for the SD cards. See Fig. #2

4. Put the card in the appropriate slot for the card you are using. The CF card goes in the slot marked with the letter B in Fig. #1. If you put the cards in correctly the light on the card reader should blink and a white icon will show up on the "Desktop".

5. With OSX a program called "iPhoto" will start after you insert the card into the card reader. We will not be using this program so go ahead and quit it.

6. Next open up the white icon (double click) that represents the card. Locate and double click on a folder named "DCIM". Open the next folder and locate your images. Drag your images to the LRF that you created for your assignment.

7. After you have the images in your folder, drag the images to the "Trash" and empty the trash.

8.. **IMPORTANT!!!!!!** When you are ready to take the card out, you must drag the white icon to the "Trash" or "Eject" symbol on the dock.
